# SIT313 C1 | New Post Page

DEV@Deakin - implementation report | 14 October 2026

Repository: akashapple1107-rgb/SIT313-FullStack-
Project files: C1/task-p4

The page extends the P4 app with a Question/Article selector. React useState controls the selected type, separate drafts and validation errors. Conditional rendering adds Abstract for articles and updates field labels.

## 1. Question form

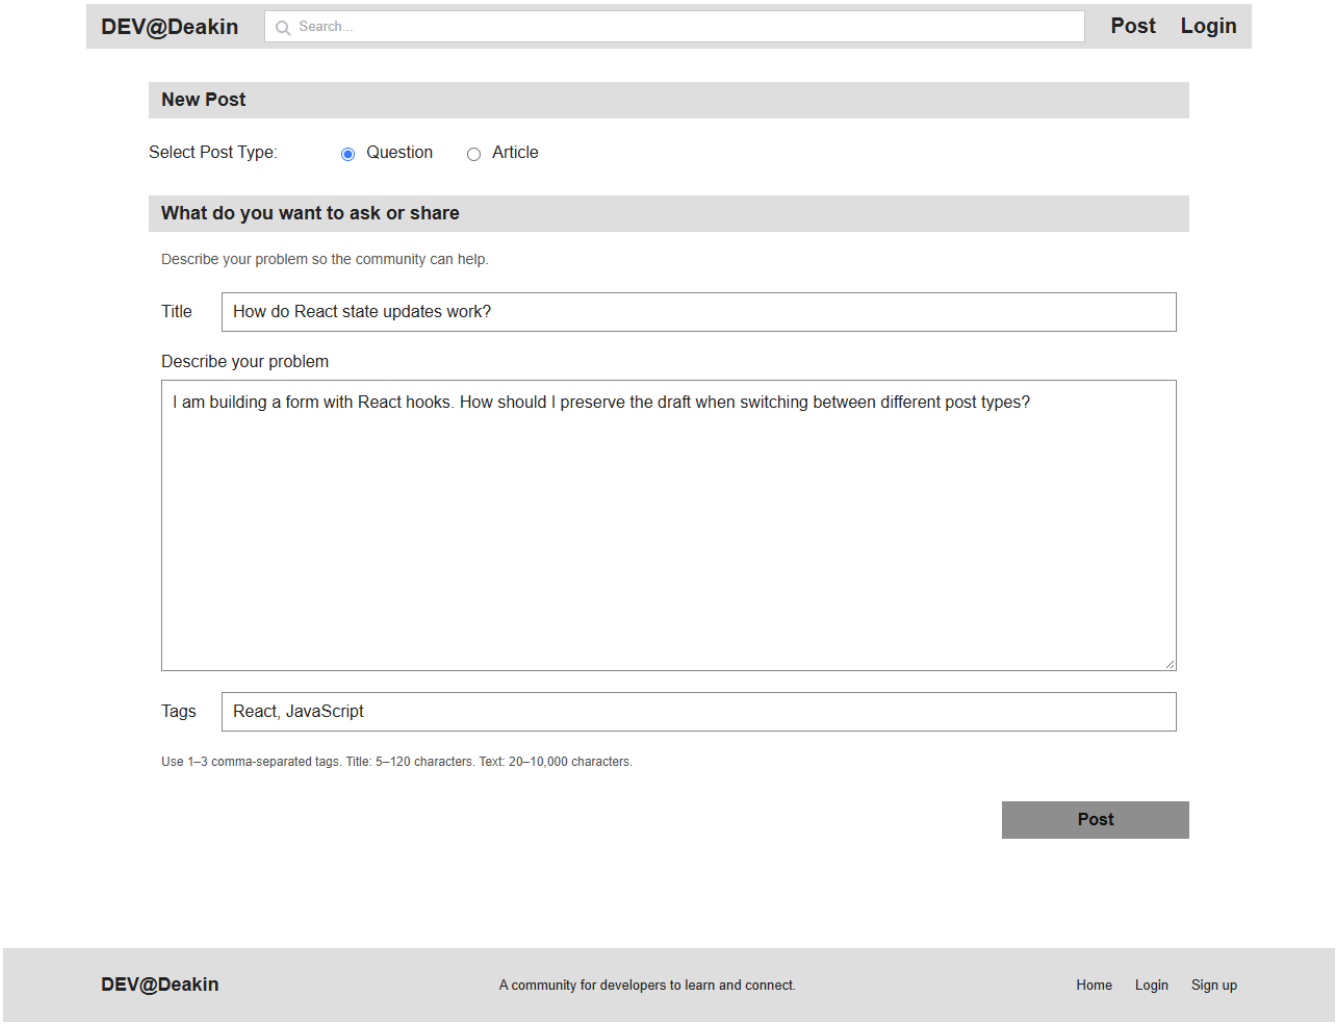

Figure 1. Question title, problem description and tags, followed by the Post button.

# 2. Article form

Choosing Article displays Title, Abstract, Article Text and Tags. Switching back preserves the question draft. The Post button displays simulated success only after validation; it does not save or publish a post.

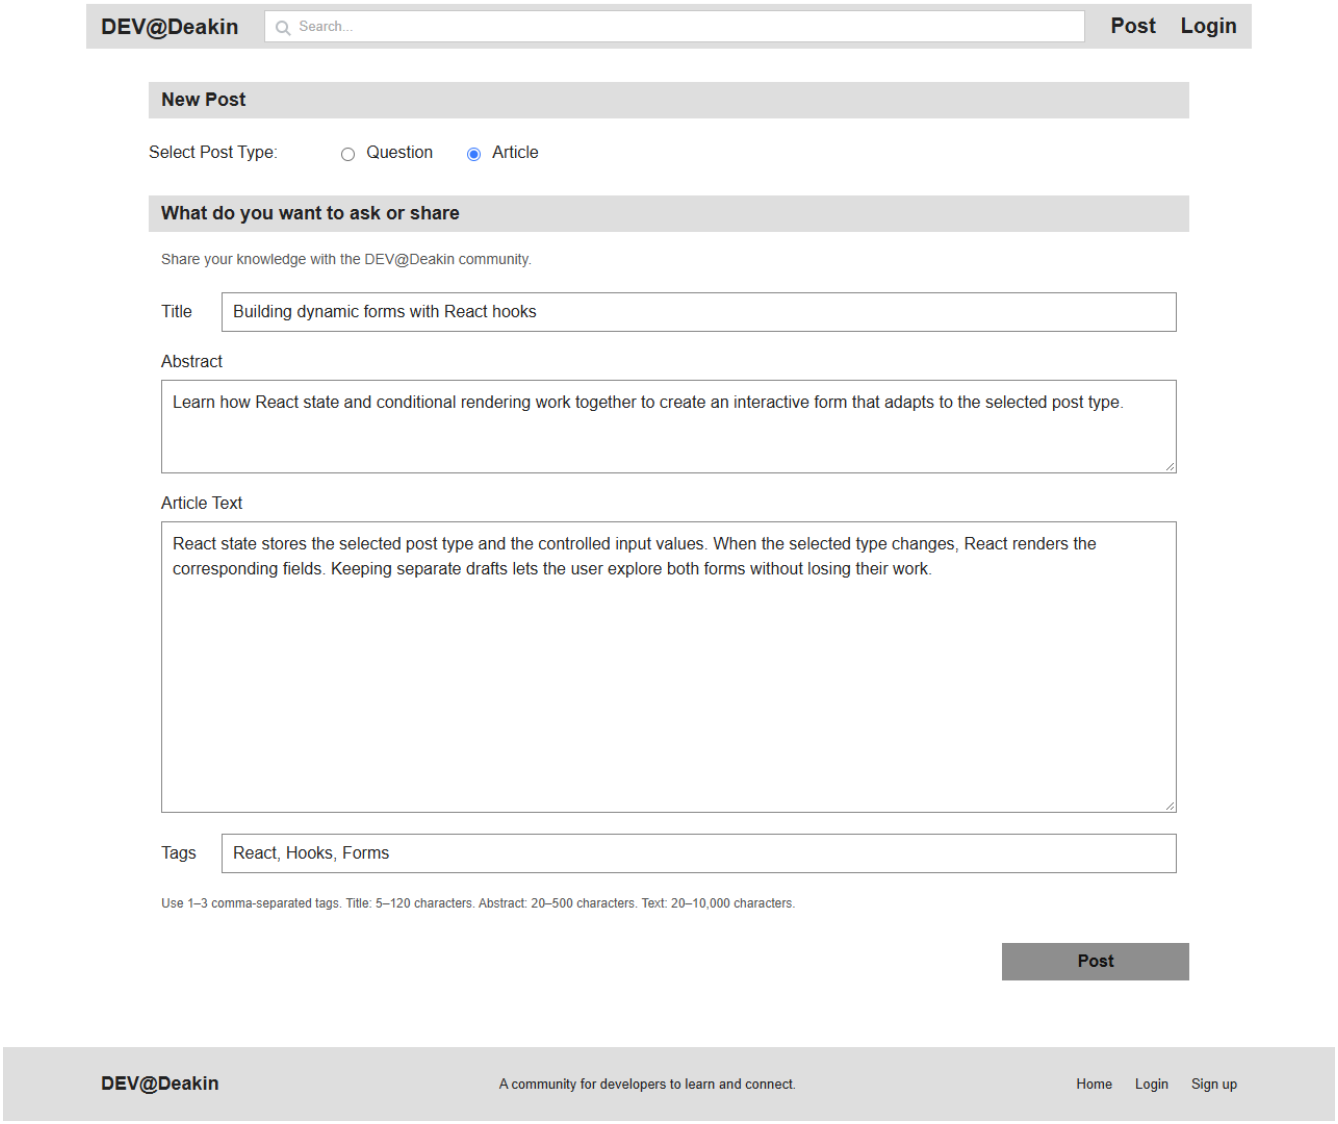

Figure 2. Article-specific fields shown through conditional rendering.

Validation checks trimmed required values, title and text length, a single-paragraph abstract, and one to three distinct comma-separated tags. Invalid submission shows a popup, field errors and focus on the first invalid input.

# 3. Responsive layout and verification

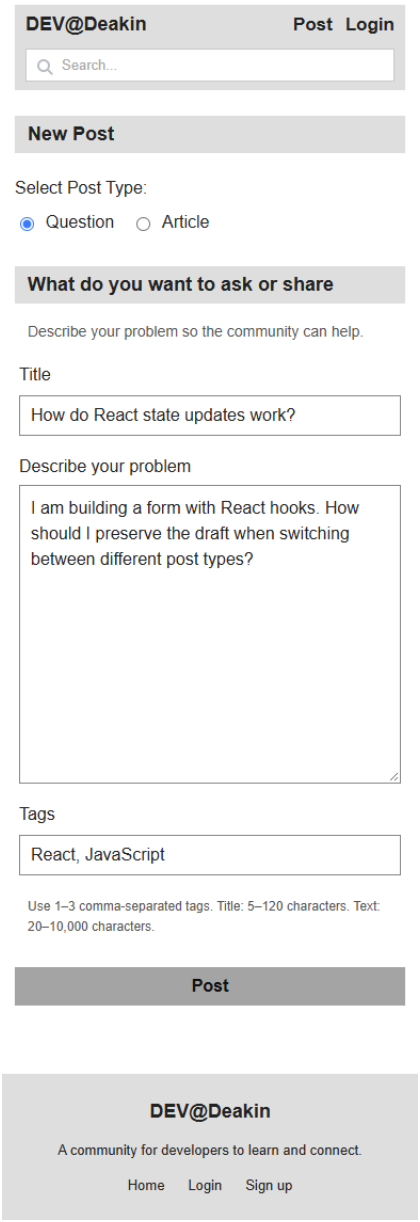

Figure 3. Question form at a 390-pixel viewport; no horizontal overflow.

Checks passed: production build, five validation tests, browser navigation, both post types, invalid/success popups, draft retention and mobile overflow checks. Screenshots show demonstration content.

## Submission status

GitHub is the requested hosting destination; the assignment specifies an Internal GitLab project. Panopto video link: not provided. Video recording and OnTrack submission remain to be completed.

AI assistance was used to develop this implementation. The assignment restricts AI-written submission code; confirm permitted use with the tutor before submitting.
